Sample:

Multistage probability sampling up to households with quotas of sex and age 1. Locality 2; Census units 3: Blocks 4. Households 5. interviewed Total number of clusters: 206 Sex and age quotas at home Sampling final unit selection in each home (the respondent) using age and sex quotas, according to the population census. Substitution permitted: Household selection: Interviewers are asked to stand in the left superior extreme of each block. From this point, they have to count 5 households and interview number 5. If the interview is Successful: they will have to count again 5 households and interview number 5 (10 of the total) and so on. If the interview is unsuccessful, for substitution they will have to try with number 6, 7, 8 and so on. Taking as sample framework the population census cartography, census radios are stratified according to the geographical location and social and economic level. Socio Economic level is defined according to the education of the head of household.. From this stratification, census radios are selected at random and in each of them, a block is chosen.

Survey procedure:

Personal Face to Face Interview

Response rate:

Total number of starting names/addresses: 5425 - no contact at selected address: 1949 - no contact

with selected person: 782 - refusal at selected address: 815 - full productive interview: 1030 -  
Partially productive interview: 15 - Households in which quota was achieved: 839

Remarks about non-response:

Insecurity reasons make interviews difficult , mainly in big cities and non response rate is higher.in upper and lower classes.

Weighting:

By Socioeconomic status and region

## ARMENIA 2011

Geographical scope:

Armenia

Principal investigator(s):

Caucasus Research Resource Centers Program of the Eurasia Partnership Foundation (CRRC/EPF), Armenia Heghine Manasyan (PI for 2011 WVS in Armenia) Dr. Heghine Manasyan, Country Director Caucasus Research Resource Centers-Armenia (CRRC-Armenia) 52 Abovyan Street, Room 312, Yerevan, Armenia Tel.: (37410) 58 13 30 Fax: (37410) 58 14 50 www.crrc.am Dr. Hans Gutbrod Regional Director Caucasus Research Resource Centers (CRRC) 29/31/33 Chavchavadze Ave. 0179 Tbilisi Georgia hans@crrccenters.org www.crrccenters.org +995 99 782 718 Tatevik Mkrtchyan: tatevmk@yahoo.com

Data Collection Organization:

Heghine Manasyan with Hans Gutbrod's supervision and Tatevik Mkrtchyan's assistance.

Fieldwork Period:

28-09-2011 - 09-10-2011.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1100

Estimated Error:

3,0

Questionnaire:

The order of the questions strictly followed the master questionnaire. Thus, there were added 2 more questions – V125A, V215A

Sample:

The stratified two stage cluster sample using PPS was employed. (i) A complete list of Armenian Households provided by the "Electricity Networks of Armenia" company was used as a sampling frame. It contains all households/electricity users in Armenia having paid for electricity for the period of December 2010 - February 2011. (ii) The stratification was carried out at two levels: (a) regional (Yerevan and 10 regions/marzes) and, (b) in each stratum the second level of stratification by urban/rural criterion (sub-strata). In Yerevan (capital) the 7 districts were considered as sub-strata. Proportionate stratification (PPS) was applied at the two levels of stratification. (iii) The selection of primary sampling units (PSUs) – clusters (city blocks) was carried out in each stratum at first. The

equal sized clusters of households were selected in each stratum using simple random sampling (SRS). (iv) At the second stage the secondary sampling units (SSUs), i.e. households were selected in each already selected cluster, using the SRS method. In each selected PSU 20 SSUs were selected. (v) In each selected household (SSU) the respondent (final sampling unit) was selected using the recent birthday method.

**Survey procedure:**

Personal Face to Face Interview

**Weighting:**

During and after data collection, representativeness of the sample with respect to nationally based criteria has been checked. Deviations from the population's distribution on these criteria were observed. These deviations have been corrected by a weighting variable.

## AUSTRALIA 2012

Geographical scope:

Australia

Principal investigator(s):

Ann Evans Department of Sociology Australian National University Canberra, Australia

ann.evans@anu.edu.au Ian McAllister Department of Political Science Australian National University  
Canberra, Australia ian.mcallister@anu.edu.au

Data Collection Organization:

Department of Political Science Australian National University

Fieldwork Period:

01-08-2012 - 31-10-2012.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1477

Estimated Error:

2,6

Sample:

A total of 5,000 sample members were randomly selected from the adult Australian population who are on the electoral roll. This selection was provided by the Australian Election Commission (AEC) for a one-time use only for the purpose of conducting this survey. The sample of 5,000 records was further divided into two batches with batch 01 consisting of 4,211 records and batch 02 consisting of 789 records. This batching was undertaken with the view that batch 01 would be sufficient to achieve the target sample size of  $n = 1,600$  and batch 02 to be used only as a top-up, if required.

Survey procedure:

Postal interview

Fieldwork:

Selected sample members were sent a survey booklet as part of the initial approach inviting to take part. This was a 28-page booklet comprising of the cover page with details of the survey including a web address to the online version of the survey and a unique username and password if the sample member chose to complete the survey online. The second page of the booklet covered the frequently asked question and a 'how to fill out this questionnaire' section to assist respondents. See Appendix

A1 for a copy of the survey booklet. The survey booklet was posted in a window faced C4 envelope along with a reply paid C4 envelope for the respondent to mail the completed survey booklet back. Key dates and milestones for the survey invitation is summarised in Table 3. Procedures to maximise response for the World Values Survey included: Having an online survey option available for sample members; Operation of a World Values Survey helpdesk with a 1800 number and an email address to help establish survey bona fides, address sample members' queries, and encourage response; Reminder activities including reminder card, reminder survey booklet and a reminder letter; Incorporating a 'top-up' batch to boost total returns; Extending the cut off date to accommodate later arrivals and responses received from remote locations; and Having an incentive scheme with a chance to win one of four \$500 prize draw (total prize pool of \$2,000).

#### Response rate:

A total of 1,477 surveys were received as of 16 October 2012 with 1,286 hardcopy surveys and 191 online completes. Completed surveys 1,477 29.5% Non response 3,184 63.7%

#### Remarks about non-response:

The fieldwork period was extended to accommodate late arrivals. All Total records available 5,000 100.0 Completed surveys 1,477 29.5% Hardcopy 1,286 Online 191 Refusals / Opt outs 133 2.7% Return to Sender (RTS) 206 4.1% Non response 3,184 63.7%

#### Weighting:

A "rim weighting" approach was used to adjust the data for differential survey response rates across age (18-34 years, 35-44 years, 45-54 years, 55+ years) by educational attainment (university degree, not university), gender and state/territory. The weights were created using a statistical regression approach which seeks to achieve the "best fit" possible with the population proportions specified by the weighting variables while disturbing the overall data as little as possible. The "rim weighting" algorithm provided in the Quantum analysis software was used to develop sample weights. Source data for weighting was the 2011 Census of Population and Housing in the case of gender and state and the 2006 Census of Population and Housing for educational (and age) as educational attainment data had not been released for the 2011 Census by the completion of the survey. Respondents who did not provide their age were assigned to survey average age (45 to 54 years) for weighting purposes.

## AZERBAIJAN 2011

Geographical scope:

Azerbaijan

Principal investigator(s):

Tair Faradov Deputy Director and Senior Research Fellow International Center for Social Research (ICSR) Baku, Azerbaijan tfaradov@gmail.com

Data Collection Organization:

International Center for Social Research (ICSR) Baku, Azerbaijan

Fieldwork Period:

08-12-2011 - 30-12-2011.

Universe:

Missing, Missing, Missing

Sample size:

1002

Estimated Error:

3,2

Sample:

11 economic regions of Azerbaijan were identified as initial strata. 100 PSUs were randomly selected with probability proportional to size of each strata, and then 12 persons were systematically selected in each PSU. The full list of election districts within each stratum were used for random selection of PSUs, and the full lists of voters within selected election districts were used for random selection of respondents. Both election districts (PSUs) and voters (respondents) were selected from the lists published on the official website of Central Election Commission of Azerbaijan (<http://www.infocenter.gov.az>). Thus, two-stage area probability sampling was applied: (1) At the first stage - random selection of 100 PSUs proportionally to size of each strata; (2) At the second stage - random selection of 12 respondents within each PSU.

Survey procedure:

Missing

## BELARUS 2011

Data Collection Organization:

Serban Tanasa

Fieldwork Period:

18-11-2011 - 15-12-2011.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1535

Estimated Error:

2,6

Sample:

The sample is representative of the adult population of Belarus aged 18+ and the sample size is 1,500 respondents. The survey covers all regions (oblasts) of Belarus based on the administrative and territorial division of the country: Minsk, Vitebsk, Mogilev, Gomel, Brest, Grodno oblasts and Minsk (capital city). The number of interviews is distributed by settlements taking into account the number of population residing in these settlements. The distribution was calculated in several stages: 1. The number of interviews for urban and rural areas was allocated taking into account the percentage ratio of the urban and rural population within the universe; 2. The number of interviews for oblasts was allocated taking into account the percentage ratio of the population of all oblasts; 3. Allocation of interviews by settlements. The urban population in each oblast is represented by the following types of towns: capital city, oblast city (centre), large-size town (>100 thousand people), medium-size town (100 - >50 thousand people) and small-size town (50 thousand people). The towns are selected so that they are distributed uniformly throughout each oblast. The number of interviews is determined taking into account the share of the population of each of the above

mentioned types of towns. The rural population is represented by rural settlements situated within the range of 20km from the sampled towns. The random route method is used to select the respondent. Moving along the route: the total number of houses on the street is divided by two, the resulting figure is a starting point of the route. The interviewer contacts each flat with a compulsory observance of the principle of three call-backs (at different times, not earlier than in two hours and on different days (weekdays and weekends). Walk along the route is done using a skip interval of n+5 from the realized interview. The respondent within a household is selected using the recent birthday rule.

**Survey procedure:**

Personal Face to Face Interview

**Fieldwork:**

The method of data collection is face-to-face interviewing at the respondent's home using the structured questionnaire.

**BRASIL 2014**

## COLOMBIA 2012

Geographical scope:

Colombia

Principal investigator(s):

Andrés Casas andres\_casas@yahoo.com

Data Collection Organization:

CENTRO NACIONAL DE CONSULTORÍA

Fieldwork Period:

17-11-2012 - 06-12-2012.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1512

Estimated Error:

2,6

Questionnaire:

We took as model the Master English Questionnaire, and the questionnaire from Uruguay. Optional WVS questions included: coV9, coV40, coV44, coV48, coV79, coV115, coV139, coV169, coV171, coV178, coV183, coV184, coV189, coV210, coV250, coV256. All the questions were previously approved by the WVSA. Country-specific questions included: Even thou one of the new questions was included just before the demographics, the rest of the options were included as additional response alternatives within already existing questions. All this changes were previously approved by the WVSA. Questions were not included: V186 (a civil war). The omission of this option obeys to the current situation that is going on in our country. WVSA authorized its exclusion.

Sample:

The sample is representative of the adult population of Colombia aged 18+ and the sample size is 1,512 respondents. Sampling procedure: Stage 1: Municipalities selection: biggest municipalities were included, smallest municipalities were randomly selected. Stage 2: Block selection: within CNC's sampling frame. Stage 3: Individual selection: Interviewers were instructed to apply 4 interviews per block, according to age and gender quotas. Sampling units are multilevel: municipalities (50 in total); blocks (370 urban and 60 rural); households. The observation unit is the individual.

**Remarks about sampling:**

- Etapa 1: La selección de municipios será aleatoria dentro de cada estrato. (Unidades primarias de Muestreo: UPM). - Etapa 2: Selección de Manzanas (Unidades secundarias de Muestreo: USM). Como se ha definido un MAS para la selección de las manzanas, uno de los métodos descritos para la selección de las manzanas al interior de cada estrato definido la población de cada estrato socio-económico es el método coordinado negativo: Método coordinado negativo: Para la de terminación de una muestra de tamaño  $n$  se definen los siguientes pasos: 1. Generar  $N$  realizaciones de una variable aleatoria  $\xi_k$  con distribución uniforme  $(0,1)$ . 2. Asignar  $\xi_k$  al elemento  $k$ -ésimo de la población. 3. Ordenar la lista de elementos descendente (o ascendente) con respecto a este número aleatorio  $\xi_k$ . 4. Por último, seleccionar los  $n$  primeros (o los  $n$  últimos) elementos que corresponderían a la selección de la muestra. - Etapa 3: Selección de Hogares (Unidades terciarias de Muestreo: UTM). Para la terecera etapa, nuevamente se define un MAS como diseño y por lo tanto el método de selección de las USM, se utilizara método coordinado negativo: Método coordinado negativo: Descrito en el punto anterior.

**Survey procedure:**

Missing

**Response rate:**

We did not have any major obstacle or limitation during fieldwork. Response rate was high.

**Remarks about non-response:**

We allowed block substitution in case the assigned block was not enough to complete de 4 surveys according to quotas. Individuals in the new block had to have similar quota characteristic than the replaced individual in the discarded block.

**Weighting:**

Sex and age

## CYPRUS 2011

Geographical scope:

Cyprus

Principal investigator(s):

Birol Yesilada - Department of Political Science Portland State University Portland, Oregon, USA.  
yesilada@pdx.edu

Data Collection Organization:

Two Research Centers (CYMAR on the Greek side of Cyprus and KADEM on the Turkish side of Cyprus) conducted the study for PI Birol Yesilada. The two Research centers coordinated their survey efforts in the past and have participated in large-scale surveys including the Eurobarometer and local survey projects. KADEM in TRNC conducted the WVS 2005-06 in the Turkish part of Cyprus. CYMAR in the Republic of Cyprus conducts the EVS in Cyprus. Both Centers worked under the supervision of the WVS-Cyprus PI Dr. Birol Yesilada of Portland State University who went to Cyprus in September 2011 to coordinate logistics (e.g., training of survey teams, coordination, and quality control). He received assistance from Dr. Craig Webster (University of Nicosia, Cyprus), and Dr. Harry Anastasiou (Portland State University, USA) and Peter Noordijk (Portland State University).

Fieldwork Period:

03-10-2011 - 23-11-2011.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1000

Estimated Error:

3,2

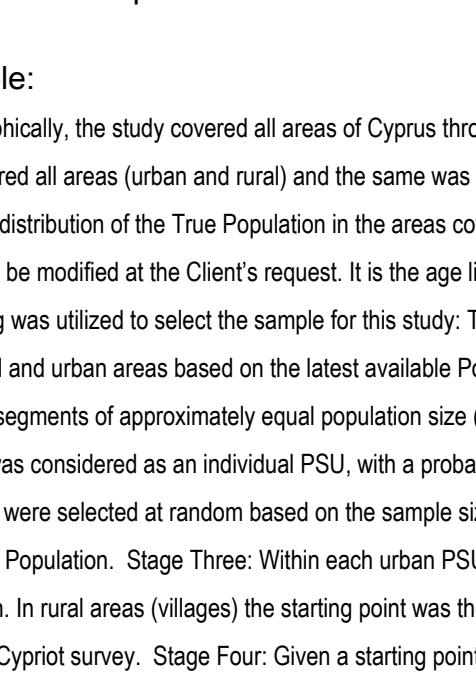

Questionnaire:

The questionnaire for the study was provided by the PI (Dr. Yesilada in Portland State University and his team) in Greek and in Turkish. Translation to Greek and back translation was supervised by Harry Anastasiou. Translation to Turkish and back translation was supervised by Birol Yesilada. CYMAR checked the Greek questionnaire versus the English master and inform the PI of any problems.

Necessary changes made to capture linguistic and cultural nuances. KADEM checked the Turkish questionnaire versus the English master copy and informed the PI of any problems in a similar fashion. A total of 50 pilot interviews were conducted each in the Republic of Cyprus and in TRNC before fieldwork commenced to check the functionality of the questionnaire and the degree to which individual questions were comprehensible by respondents. Following the results of the pilot

interviews the questionnaire there was no need to undergo further changes.

#### Sample:

Geographically, the study covered all areas of Cyprus through two surveys (same procedure as in the 2005-2006 Survey). In the Republic of Cyprus we covered all areas (urban and rural) and the same was done in the north, which is the Turkish controlled TRNC. Sample distribution were in line with the distribution of the True Population in the areas covered by the study. Eligible to participate in the study limited to ages 18 to 70 years old (this can be modified at the Client's request. It is the age limit used in the previous WVS wave conducted in Cyprus). Stratified random probability sampling was utilized to select the sample for this study: The sampling involved five stages as follows. Stage One: Areas of the island was divided into rural and urban areas based on the latest available Population Census in each community. Urban settlements were further subdivided into smaller segments of approximately equal population size (1000 residents) and constituted a Primary Sampling Unit (PSU). In rural areas, each village was considered as an individual PSU, with a probability of being selected that was proportionate to its population size. Stage Two: A number of PSUs were selected at random based on the sample size using purpose-built software. The selection of PSUs by area was in-line with the size of the True Population. Stage Three: Within each urban PSU selected, a street was randomly selected to serve as the starting point for household selection. In rural areas (villages) the starting point was the temple in the centre of the village for the Greek Cypriot survey and the local café for the Turkish Cypriot survey. Stage Four: Given a starting point, interviewers proceed in a predetermined fashion, selecting every 3rd household they encountered in the sample. For each starting point an equal number of interviews were allocated (10). Presented below is the route that interviewers followed in order to cover the required number of interviews in each area. Given a starting point, the interviewer commenced his/ her route in a clockwise fashion walking on the right hand side of the street covering block A and knocking on the door of every third household encountered. If the required number of interviews were covered in block A, then the interviewer crossed over to block B and continued walking on the right hand side of the street. The interviewer continued around block B until the required number of interviews was conducted. If this did occur, then the interviewer crossed over to block C following the same procedure as before and continued selecting households until the required number of interviews were carried out.  Stage Five: In each household selected, screening questions were used at the beginning of the interview to filter out respondents not eligible for participation in the study. Following this, the names and birth dates of all inhabitants eligible to participate in the survey were recorded. The person with the last birthday before the date of the interview was chosen for the interview. In the event that the selected individual was absent, or the residents of the selected household were absent, the interviewer made two additional attempts to locate them. In the event that the interviewer was unable to locate the individual then the selected household was substituted by another household from the same strata.

#### Remarks about sampling:

The sample size for the study is set to 500 interviews in the Republic of Cyprus. Based on the actual distribution of the population, the sample distribution by area within district will be as follows: Urban Rural Nicosia 150 50 Limassol 110 30 Larnaca 50 30 Pafos 30 20 Ammochostos 30 Total 340 160  
The sample size for the study is set to 500 interviews in the TRNC. Based on the actual distribution of the population, the sample distribution by area within district will be as follows: Urban Rural Lefkosa/Nicosia 140 55 Magusa 80 30 Girne 90 20 Guzelyurt 30 20 Iskele 35 Total 340 160

#### Survey procedure:

Personal Face to Face Interview

#### Fieldwork:

As indicated in our pre-survey report, face to face interviews were conducted at the residence of respondents chosen in the sample (see below for sampling procedure). For the purposes of this project, 4 regional supervisors and 25 interviewers were employed on both sides of the Island. All interviewers employed for this project are experienced in face to face interviews procedures. Before fieldwork commenced, all interviewers and regional supervisors participate in a one-day training session. This training session was carried out respectively in each community by the fieldwork manager, who briefed interviewers on the background, purpose and method of the survey. Intensive in-house training on sample selection procedures and questionnaire administration followed, together with an analysis and discussion of every question in the questionnaire. To examine the degree to which interviewers comprehended the way in which interviews had to be carried out, during the training session, trial interviews were carried out by interviewers among themselves. Interviewers were reminded of the appropriate way of filling in routing sleeps that document the route they followed and the outcome of each contact they made (completed interview, respondent absent, refusal to participate, etc) in the households selected in the sample. During the training session, the following steps were employed to lower refusal/ non-contact rates, will also be discussed: 1. Upon entering a selected household, interviewers will provide the person answering the door a letter from the research company. The letter will explain the purpose of the study, will provide respondents with contact information in the event that they wish to contact the research company to validate that such a study is being carried out, will assure respondents that their answers will be treated with utmost confidentiality, and will highlight the fact that their opinions are invaluable and will be taken into consideration. 2. Interviewers will always have on them a company i.d. card with their name which can be clearly seen by eligible respondents. 3. Interviewers will always carry out three visits before giving up on the selected person. Once the first visit fails to secure an interview with the selected individual, the interviewees will enquire as to when a more proper time would be available for either locating the selected person or conducting the interview. 4. During the training session, interviewers will be given written instructions outlining in detail each of the aforementioned issues.

#### Response rate:

The expected response rate was around 85% (worst case scenario). However, we received a 91 % response rate in TRNC and 93% response rate in the Republic of Cyprus.

#### Weighting:

The post-hoc weighting of variables was adjusted on the basis of three criteria: The population of the two linguistic/national communities in Cyprus, gender ratios within each community; and urban population concentration. The table below displays the most recent population estimates for the two communities and the outputs from the samples of completed surveys. The only substantial deviations of the sampling frames from the population estimates were the population ratio between the communities (the much smaller Turkish-speaking community was oversampled), and the reversed gender ratios of respondents to population. Census Total women men rural urban TRNC 294906 0.46 0.54 0.26 0.74 RoC 803147 0.50 0.50 0.3 0.7 Survey total women men rural urban TRNC 500 0.56 0.44 0.25 0.76 RoC 500 0.49 0.51 0.28 0.72 Weighting Factors total women men rural urban

TRNC 0.54 0.82 1.22 RoC 1.46 1.03 0.97 Notes: Data for Republic of Cyprus population estimates drawn from the Eurostat population estimates for 2010. Data for Turkish Republic of Northern Cyprus data drawn from early results of the 2011 census completed in December 2011. Urbanization estimates from United Nations Population Division, and calculated from the 2006 TRNC census. The weighting factor for Republic of Cyprus are applied in to the weight calculated by the team for the Republic of Cyprus.

Sample size:

1000

Estimated Error:

3,2

Sample:

1. Selection of Census Sub-districts (PSU): For all cities/communities included in the sample, census sub-districts (geographical areas with about 2000 habitants) are selected proportionally to the number of interviews within the locality. Depending on the territorial area covered by each census sub district in each one of them are applied between 5 and 13 interviews. For each census sub district was designed a random route that the interviewer must follow. This means that each interviewer has a map, with the route marked randomly of the part of the sub district that he must interview. 2. Household Selection: Once the interviewer was in field he must register the households in his route. Once this was done each household was selected with systematic random selection. 3. Interviewee Selection: Members of the household from 18 years to 85 years, was selected by "last birthday" systems.

Remarks about sampling:

Face to Face interviews. 1000 cases, margin of error 3%. 1000 cases urban. National representation: 70% of the total population. Covering 30 cities over 40.000 inhabitants, all 18 years and over from continental part of the territory. Number of interviews per PSU: 5 to 13. PSU are units of 2000 inhabitants according to Census data 2002.

Survey procedure:

Personal Face to Face Interview

Response rate:

Response rate: Average number of contacts/ visits to realize an interview: 1,6

Remarks about non-response:

Length of interview: Average 44 minutes Number of interviewers: 79 Number of supervisors: 24

Percentage of supervised interviews: 36% quality, 15% coversheet, 51% of the interviews were supervised through revisiting the interviewees, 22% of the supervision was confirmation of another household member, that the interview took place.

National Population, Both sexes,18 and more years

Sample size:

1200

Estimated Error:

2,9

Sample:

In this survey, the face to face interviews technique was used in collecting the data were data collectors go to the selected area under the supervision of the field work supervisor. The targeted areas were pre-selected areas. The selection of houses/apartment where been done in the field work, a systematic random sample technique was used to locate the houses. In selecting the person inside each selected house, Kish table were used to guarantee the randomness in the selection process. The studied population in the Stratified Cluster Sample was divided as follows: 1- Administrative divisions of the regions (provinces, districts, etc...): Each province was given a share of the sample in proportion to the total amount of the population. 2- Class divisions: the population was divided into classes (urban, rural, desert), and these divisions was taken into account within each province. So, this division gives the rural population a share of the sample proportion to its share in the total population. 3- Smaller communities within each division: In Jordan there is a division of the population by region and blocks and there is available maps of those region/blocks, such division would be the ideal choice for the selection of the sample, since these region/blocks are the basic units/'primary sampling unit' (PSU) of the sample which must be randomly selected, taking into account the population size.

Survey procedure:

## Personal Face to Face Interview

### Fieldwork:

For collecting the data, 40 data collectors were used with 10 field supervisor and one filed coordinator, it took 11 days to collect the data (19/2-1/3/2014), and 10 days for data coding and data entry (working parallel with the field work). CSS apply three stages for data quality control. The first: in the field, each group of data collectors (4 data collectors) has one supervisor who stays with them all the time. The Second: the field coordinator does a daily visit to the field and checks the progress of the work and check the collection process. The third: at the office the data quality team, phone 10-15% of the respondents to check some questions and make sure that the questionnaire was filled in the right ways. The data entry program has logical rules and does not allow any odd or strange answers to be entered through the data entry process.

### Remarks about non-response:

99% of interviews supervised 40% back-checked

## KAZAKHSTAN 2011

Geographical scope:

Kazakhstan

Principal investigator(s):

Data Collection Organization:

TOO «BISAM CENTRAL ASIA» for and under control BASHKIROVA AND PARTNERs, Ltd

Fieldwork Period:

09-11-2011 - 05-12-2011.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1500

Estimated Error:

2,6

Sample:

Step one: Selecting the regions, rural and urban areas covered by the survey The country has been divided into 6 regions, differing in geography and basic economic, social and demographic attributes. Two or three oblasts were selected per region. These were to represent the areas within the regions, differing by key economic, ethnic and demographic characteristics. Step two: Selection of regional sample points (urban and rural areas) in accordance with the region's population size. Sample size for each region was set proportionally to population size in this region The procedure for settlements selection in every region was the following: - Cities: The regional oblast centers have been included in the sample. The rest cities in the region were selected by means of random numbers generator. - Villages: Rural settlements were randomly selected from the common list of villages in each region and oblast by means of random numbers generator. Step Three: Selection of starting points within each sampling point. Cities: each city was split into three districts – the central, residential district and industrial district. Sampling points with maximum 10-15 interviews to conduct, were selected in every region. The number of interviews within the regions was defined proportional to number of residents. Villages: each rural settlement was divided into two areas – the central area and the outskirts, which were the sampling points, the number of interviews was equally divided between them. Altogether 152 rural sampling points have been reached in the study. Step Four: Household Selection

Household selection: a random route sample has been used for household selection. The route start at each sampling point was determined by a regional supervisor. In cities – a multistoried sector – each second house. Polling begins with the last entrance, upper store, an apartment with the greatest number. The next flat selected was the one with the greatest number skipping one store down. In one or two storey buildings each fifth household was selected. In rural – each third household was selected. If no one at home in the household selected at the moment of the visit, interviewers revisited the household at least thrice. Step Five: Respondent Selection Respondent selection in a household was carried out according to the next birthday rule. For this a list of all the household members aged 18 and older was made up. If a duly selected respondent was away at the moment of the visit, the interviewer revisited twice this household (total three visits). All the outcomes of household and respondent selection, reasons for interviewer's deviation off the route and also interview results were fixed in route sheets.

Sample:

The Mexico 2012 survey is based a multi-stage sampling procedure. In a first stage, 200 polling points were randomly selected from the full list of electoral sections defined by the Federal Elections Institute (IFE), considering a stratification of urban, rural and mixed sections also defined by IFE. The proportions of the strata are: 68% urban, 12% mixed, and 20% rural. In a second stage, the Institute's cartography was used to randomly select blocks within each section. In third stage, interviewers selected homes randomly within each block. In a fourth stage, a respondent was selected in each home following quotas based on sex and age. A total of 10 respondents were selected in each section.

Sample:

The sample for the 2010 Qatar World Values Survey is designed to ensure the reliability and representativeness of statistical results derived from the data. The sampling frame for the survey comes from the Electricity and Water Company (Kahramaa). Since Kahramaa is the sole provider of water and electricity service in Qatar, this frame covers almost all Qatari households. The State of Qatar is divided into seven administrative municipalities, each further divided into many zones. This information is used to carry out proportionate stratified sampling, which ensures representativeness in the sample and increases the accuracy of statistical estimates. Stratification does not imply any departure from probability sampling; rather, it simply requires that the population be divided into subpopulations, or strata, and that probability sampling be conducted independently within each stratum. In this survey, we used zones for stratification purposes. Within each zone (stratum), a respondent is randomly selected via two-stage sampling. In the first stage, households are randomly selected with proportionate stratification. That is, a stratum containing a given percentage of households in the population is represented by the same proportion of the total number of sampled households. In the second stage, an adult (18 years or older) within each household is randomly

selected. At this stage, all adults in the household have the same chance of being selected. A total of 1,455 households were sampled and 1,060 interviews completed, for a final response rate (using AAPOR Response Rate 4) of 73%. Based on the number of completed interviews, the survey has a sampling error of  $\pm 3.0$  percentage points. This margin of error estimate accounts for the design effect associated with the use of strata and sample data weights. Table 1 below presents the distribution of Qatari households by municipality in the frame and in the sample.

Sample:

The sample was by computer selected randomly in the different PSU. Step two was to add telephone numbers to the sample and make sure that we have used all possible ways of doing this we have used three different suppliers of phone number services, and also made manual checks. This has given a sample of 2456 respondents with phone numbers divided in the different PSU areas. To those who we could not find telephone numbers we sent letters and asked for their participation and to contact us. No hard quotas where used, quotas was used for keeping track of the sample, both for gender, age and area. This is mainly used for quality checks so that we can monitor the progress of the sample and make sure that we have a good representation of the randomly selected sample.

Survey procedure:

Personal Face to Face Interview

Response rate:

Total number of starting names/addresses: 2456 - addresses which could not be traced at all: 130 - selected respondent too sick/incapacitated to participate: 121 - selected respondent away during survey period: 204 - selected respondent had inadequate understanding of language of survey: \* - no contact at selected address: 47 - personal refusal by selected respondent: 640 - other type of unproductive (please write in full details in the box below): 22 - full productive interview: 1208 - partial productive interview: 0

Sample:

The survey utilized a three (3) stage sampling design. At the first stage, census Enumeration Districts (EDs) for Trinidad & Tobago were selected with the selection being proportional to the size of the ED. At the second stage, households within each ED are selected. This was done as follows: ED maps for the selected areas were marked with a "start" house (dwelling unit) and a sampling interval. A random walk was drawn on the map showing the exact route the interviewer must take. The interviewer was instructed to follow the route and to select every "nth" household. At the last or third stage, individuals within each household were selected. This was done so that the probability of selecting an individual within the household is the same for all eligible respondents. The last (most recent) birthday method was used to ensure this. In cases where the selected respondent is not at home, a total of three attempts were made to contact the person. Failing this, the household was substituted and a new person was selected using the same last birthday method.

We used an internet sample designed by Knowledge Networks. A description follows:

KNOWLEDGE PANEL® OVERVIEW KnowledgePanel®, created by Knowledge Networks, is a probability-based online Non-Volunteer Access Panel. Panel members are recruited using a statistically valid sampling method with a published sample frame of residential addresses that covers approximately 97% of U.S. households. Sampled non-Internet households, when recruited, are provided a laptop computer and free internet service so they may also participate as online panel members. KnowledgePanel consists of about 50,000 adult members (ages 18 and older) and includes persons living in cell phone only households. Hispanic panel members represent the full spectrum of language proficiency from exclusively Spanish speakers to those proficient in English only. In addition to the adult members, the KN panel also includes approximately 3,000 teens, ages 13 to 17, whose parents or legal guardians, usually themselves panel members, have provided consent. Due to voluntary withdrawal, involuntary retirement of high-tenured members, and the addition of new panelists from the on-going recruitment, actual panel size fluctuates across the year.

Address-based Sample (ABS) Recruitment Methodology We used an internet sample designed by Knowledge Networks. A description follows: KNOWLEDGE PANEL® OVERVIEW KnowledgePanel®, created by Knowledge Networks, is a probability-based online Non-Volunteer Access Panel. Panel members are recruited using a statistically valid sampling method with a published sample frame of

residential addresses that covers approximately 97% of U.S. households. Sampled non-Internet households, when recruited, are provided a laptop computer and free internet service so they may also participate as online panel members. KnowledgePanel consists of about 50,000 adult members (ages 18 and older) and includes persons living in cell phone only households. Hispanic panel members represent the full spectrum of language proficiency from exclusively Spanish speakers to those proficient in English only. In addition to the adult members, the KN panel also includes approximately 3,000 teens, ages 13 to 17, whose parents or legal guardians, usually themselves panel members, have provided consent. Due to voluntary withdrawal, involuntary retirement of high-tenured members, and the addition of new panelists from the on-going recruitment, actual panel size fluctuates across the year.

**Address-based Sample (ABS) Recruitment Methodology** For all new panel members, demographic information such as gender, age, race/ethnicity, income, education, and for Latino members, language proficiency are collected in an online "profile" survey. This information is used to determine eligibility for specific studies and eliminates the need for gathering basic demographic information on each panel survey. After this survey is completed, the panel member is regarded as active and ready to be sampled for other surveys. As of May 2010, all of the active KN panel households initially provided a MSN® TV unit had been transitioned to taking KN panel surveys on a laptop computer provided by Knowledge Networks.

**Panel Survey Sampling** Once panel members are profiled, they become "active" for selection for specific surveys. Samples are drawn from among active members using a probability proportional to size (PPS) weighted sampling approach. Customized stratified random sampling based on profile data is also conducted, as required by specific studies. In September 2007, KN was assigned a patent (U.S. Patent No. 7,269,570) for its unique methodology for selecting multiple online survey samples from a panel. The selection methodology, which has been used by KN since 2000, assures that multiple sequential KN panel samples from a finite panel membership will each reliably represent the U.S. population. This sampling methodology was developed by KN in recognition of the practical issue that different survey samples may target different panel subpopulations. It is not unusual that only panel members with certain characteristics are selected for a survey. This selectivity can skew the remaining panel membership demographics and affect the representativeness of later survey samples. The patented sampling methodology was developed to correct for this in panel sampling; see U.S. Patent No. 7,269,570 for more information.

**Survey Frequency & Burden** To minimize panel attrition, surveys are usually kept short (from 5 to 20 minutes in length). For surveys requiring 16 or more survey minutes, survey participation is rewarded with a variety of incentives (small cash awards, gift prizes, raffle opportunities). Further, steps are taken to ensure that panel members are not overburdened with survey requests. The primary sampling rule is to assign no more than one survey per week to members. This level of survey frequency helps to keep panelists engaged as part of the panel. On average, most KN panelists participate in about two surveys a month. This is closer to four per month for panel segments that may be in higher demand depending on the projects being fielded. KN operates a Panel Relations program to encourage participation and member loyalty. Members can enter special raffles or be entered into special sweepstakes with both cash and other prizes to be won.

**Response Rates** As a member of AAPOR, KN follows the AAPOR standards for response rate reporting. However, the AAPOR standards were not established for web panels. KN survey

scientists, Mario Callegaro and Charles DiSogra, recently published an article in Public Opinion Quarterly to provide a standard for web panel response rate calculations. See Callegaro and DiSogra (2008) for examples of response rates calculated for KnowledgePanel surveys and for details on the formulae used. Statistical Weighting KnowledgePanel® sample begins as an equal probability sample that is self-weighting with several enhancements incorporated to improve efficiency. Since any alteration in the selection process is a deviation from a pure equal probability sample design, statistical weighting adjustments are made to the data to offset known selection deviations. These adjustments are incorporated in the sample's base weight. There are also several sources of survey error that are an inherent part of any survey process, such as non-coverage and non-response due to panel recruitment methods and to inevitable panel attrition. These sources of sampling and non-sampling error are addressed using a panel demographic post-stratification weight as an additional adjustment. However, prior to this adjustment, a separate sample of Spanish-speaking Latino panel members are weighted so as to be merged into the overall panel. This language-specific group is recruited through a geographically targeted dual frame sample that is screened for Spanish-language dominant households. The weighting of this unique sample involves a Spanish-language base weight that incorporates several adjustments including ones that address geographic frame and language proficiency. The panel demographic post-stratification weight is then calculated for all panel members and proportionally adjusts for the merged Spanish-speakers.

## ZIMBABWE 2012

Geographical scope:

Zimbabwe

Principal investigator(s):

Pipa Norris John F. Kennedy School of Government Harvard University Cambridge, MA 02138 Tel.: (US) 1 857 445 9105 E-mail: pippa\_norris@Harvard.edu

Data Collection Organization:

TOPLINE RESEARCH SOLUTIONS ON BEHALF OF TNS RMS NIGERIA

Fieldwork Period:

09-01-2012 - 17-01-2012.

Universe:

National Population, Both sexes, 18 and more years

Sample size:

1500

Estimated Error:

2,6

Sample:

Five stages were observed during the sample selection up to respondent selection. 1) Selection of PSU In all the 10 regions/provinces of the country, Primary sampling units were selected from a comprehensive list of PSU that reflect rural sample split. 2) Selection of sectors Using a random numbers book, the sectors were selected from an exhaustive list of possible sectors within the particular PSU. The entry point into each was determined by the supervisor/team leader identifying all the possible entry points into the sector with youngest member of the interviewing team selecting the entry point to the sector. This became the starting point for the team. 3) Selection of starting points Upon entry to a starting point, the team leader would then establish each interviewer's random walk route. From this point onwards, the interviewer then determined the route for his day's work as well using the date rule to establish the first household he would consider for interviewing on each particular day. Urban street maps and rural grid maps were also made available to interviewers for ease of identifying the exact starting point. 4) Selection of households After having identified the first household to carry out an interview using the date rule, every subsequent fifth household in high density suburbs and every third in low density suburbs was then selected for the next interview. In rural areas a metric distance of about 150 metres was observed in between successful contacts. Our definition of household was a building with a cooking facility, where occupants living together shared at least one meal a day recognizing a head of the household. In order for a particular person to qualify

to be interviewed, he or she should have lived in the particular household for the past six months from the day of interview. 5) Selection of respondents The fifth and final stage in the sampling process was the selection of final respondent within each particular household. The birthday rule was applied in selecting the final respondent. All names of members of the household aged 18 years and above, both male and female were listed down. Interviewers then asked to speak to the person who had the last birthday in the household as the final respondent. Substitutions/refusals/call backs Three attempts spread over two days were made before any attempts to substitute a respondent were made. Substitution of respondents was only done with the consent of the supervisor by going to the household that was directly next to the original household. In case of outright refusals by respondent or household, the interviewer would then also go to the next household and continue until a successful contact was made.

**V98.-** Now I'd like you to tell me your views on various issues. How would you place your views on this scale? 1 means you agree completely with the statement on the left; 10 means you agree completely with the statement on the right; and if your views fall somewhere in between, you can choose any number in between. "Government should take more responsibility to ensure that everyone is provided for" vs. "People should take more responsibility to provide for themselves"

	TOTAL	The government should take more responsibility to ensure that everyone is provided for	Government responsibility									People should take more responsibility to provide for themselves	DE,SE:In applicable	RU:Inappropriate response	HT: Dropped out survey	No answer	Don't know

**V99.-** Now I'd like you to tell me your views on various issues. How would you place your views on this scale? 1 means you agree completely with the statement on the left; 10 means you agree completely with the statement on the right; and if your views fall somewhere in between, you can choose any number in between. "Competition is good. It stimulates people to work hard and develop new ideas" vs. "Competition is harmful. It brings out the worst in people"

**V100.-** Now I'd like you to tell me your views on various issues. How would you place your views on this scale? 1 means you agree completely with the statement on the left; 10 means you agree completely with the statement on the right; and if your views fall somewhere in between, you can choose any number in between. "In the long run, hard work usually brings a better life" vs. "Hard work doesn't generally bring success—it's more a matter of luck and connections"

	TOTAL	In the long run, hard work usually brings a better life	Hard work brings success									Hard work doesn't generally bring success - it's more a matter of luck and connections	SE:Inapplicability	RU:Inappropriate response	No answer	Don't know

**V131.-** Many things are desirable, but not all of them are essential characteristics of democracy. Please tell me for each of the following things how essential you think it is as a characteristic of democracy. Use this scale where 1 means "not at all an essential characteristic of democracy" and 10 means it definitely is "an essential characteristic of democracy": Governments tax the rich and subsidize the poor

**V134.-** Many things are desirable, but not all of them are essential characteristics of democracy. Please tell me for each of the following things how essential you think it is as a characteristic of democracy. Use this scale where 1 means "not at all an essential characteristic of democracy" and 10 means it definitely is "an essential characteristic of democracy": People receive state aid for unemployment

**V137.-** Many things are desirable, but not all of them are essential characteristics of democracy. Please tell me for each of the following things how essential you think it is as a characteristic of democracy. Use this scale where 1 means "not at all an essential characteristic of democracy" and 10 means it definitely is "an essential characteristic of democracy": The state makes people's incomes equal

**V138.-** Many things are desirable, but not all of them are essential characteristics of democracy. Please tell me for each of the following things how essential you think it is as a characteristic of democracy. Use this scale where 1 means "not at all an essential characteristic of democracy" and 10 means it definitely is "an essential characteristic of democracy": People obey their rulers

**V139.-** Many things are desirable, but not all of them are essential characteristics of democracy. Please tell me for each of the following things how essential you think it is as a characteristic of democracy. Use this scale where 1 means "not at all an essential characteristic of democracy" and 10 means it definitely is "an essential characteristic of democracy": Women have the same rights as men

**V195.-** Now, I would like to read some statements and ask how much you agree or disagree with each of these statements. For these questions, a 1 means that you “completely disagree” and a 10 means that you “completely agree”: One of the bad effects of science is that it breaks down people’s ideas of right and wrong

**Y003.- Autonomy Index** is a computed variable based on the Children qualities battery. It uses only four variables: V19= Important Child Qualities: Religious Faith V21= Important Child Qualities: Obedience V12= Important Child Qualities: Independence V18= Important Child Qualities: Determination, Perseverance Only variables with answers to all v19,v21,v12,18 have an index. The SPSS like formula is: Compute Y003=-5. if v19>=0 and v21>=0 and v12>=0 and v18>=0 then Y003=(v19 + v21)-(v12 + v18).
